Joseph Bervell, PE  
(Snohomish County Public Works)

A dark blue watercolor splash shape is centered on a white background. The splash has irregular, feathered edges and contains several smaller, lighter blue splatters and dots. The text is overlaid on this splash.

# Using Soundcast to Build a Sub-regional model for Snohomish County

---

June 24, 2020

Model Users Group  
(Presentation)

# The Current Snohomish County Model

---

- Is based on PSRC's 4K model.
- It was initially developed to support the County's 2015 Comprehensive plan update.
- Uses 2010 and 2035 allocated land use data as input.

# The Current Snohomish County Model

---

- 699 MAZs covering Snohomish County
- 750 aggregated TAZs and Park & ride lots

- *Definitions:*
- MAZ = Micro Analysis Zone
- TAZ = Traffic Analysis Zone

# The Current Snohomish County Model

---

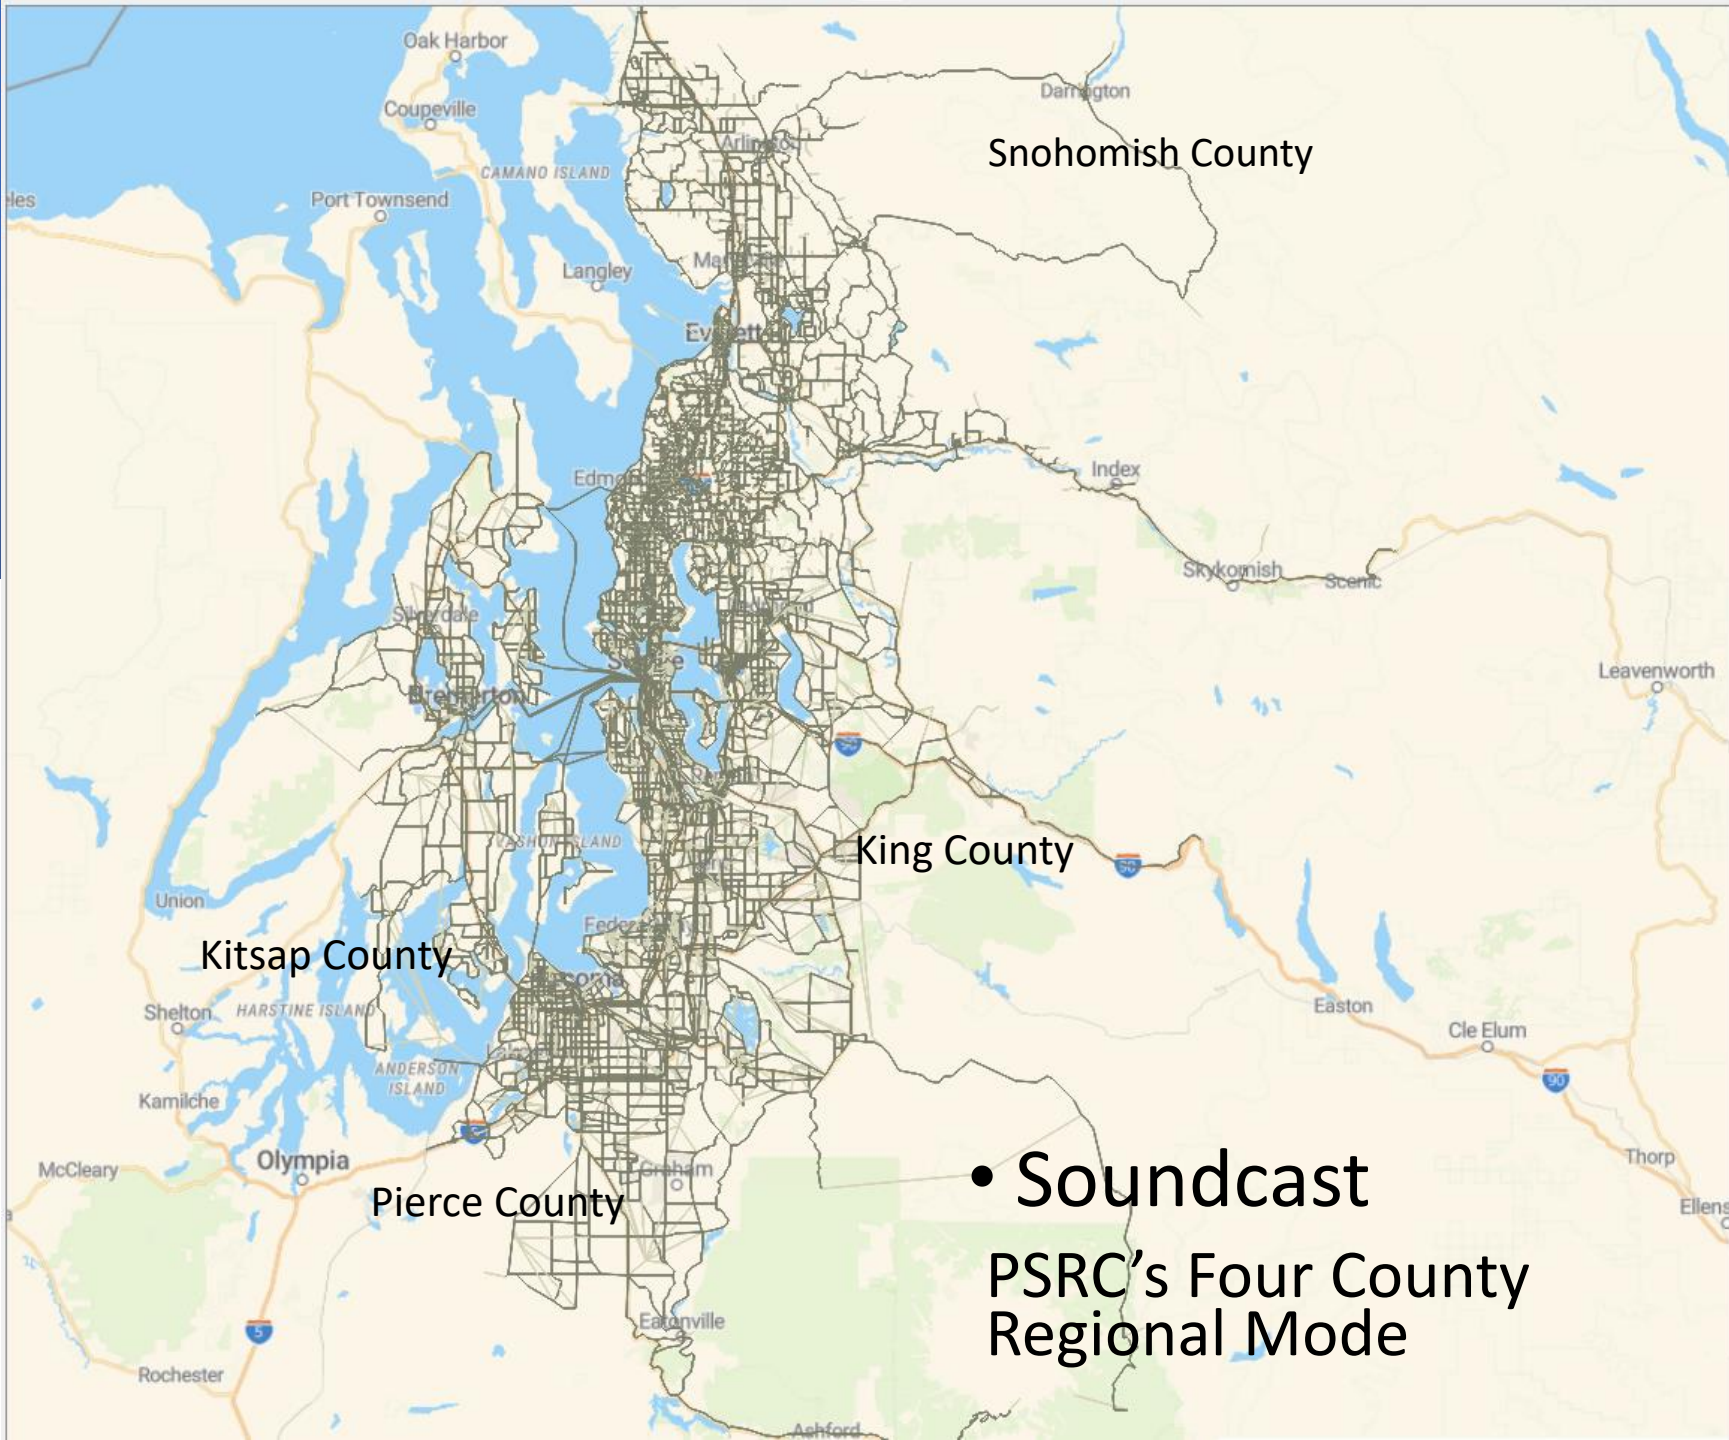

- The model is used to support
  - The County's comprehensive plan updates
  - Traffic mitigation and arterial concurrency analysis
  - Property development impacts determinations
  - Small area transportation studies
  - Inputs to Impact Fees models
  - Transportation system needs of the County
  - Travel demand forecasts requests from consultants

# SoundCast

- PSRC has developed the Soundcast activity based model.
- We obtained the available Soundcast databanks for
  - Base year 2014 and Vision year 2040

## Databank Components:

- Transit and auto networks
- Python scripts
- Daysim to EMME integration scripts
- Land use input data and
- Other miscellaneous supporting files

• Soundcast  
PSRC's Four County  
Regional Mode

# Set up Challenges

Getting the installed Soundcast model to run required a lot of support from PSRC staff.

*(Had great support from Stefan and Brice. Thanks, guys.)*

- Some initial issues included
  - Getting the virtual environment call functions to work
  - Ensuring that the “*external\_Work\_NonWork\_Inputs*” file was the latest update from PSRC and
  - Some accessibility calculation errors

# Soundcast run time

- Run in Emme Shell
- Total run time:  
21:45:45

```
Administrator: Emme Shell (v.4.3.7 64-bit)

# Developing the SnoCast Model

- **General Steps**

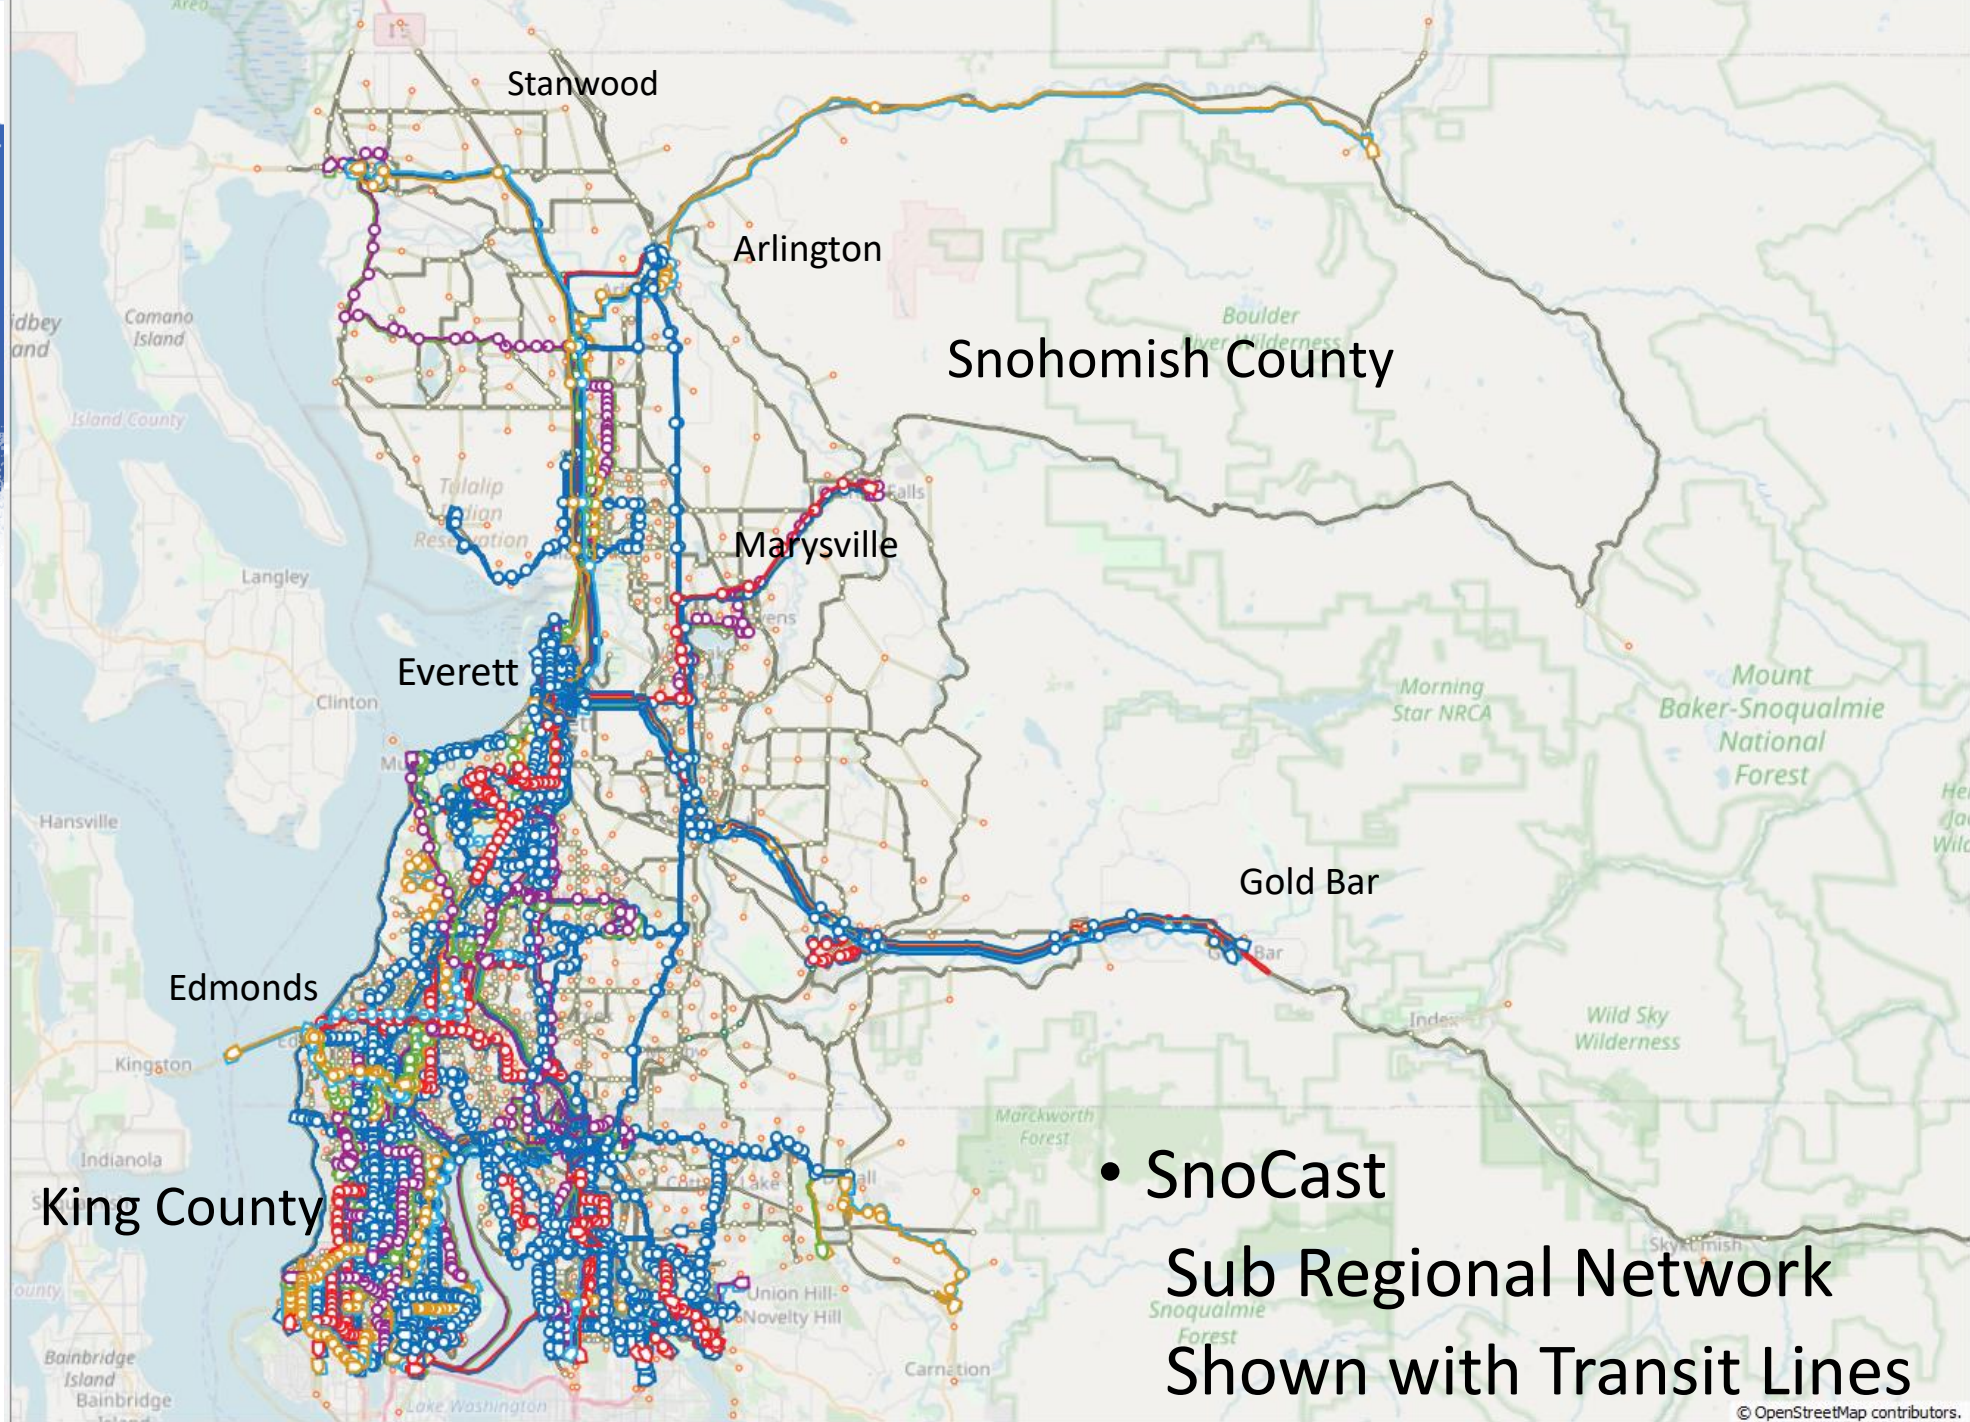

- Using the subarea toolbox from Emme – Modeler
- Extracting the SnoCast sub model from the Soundcast model
- Adding network details to the SnoCast network
- Split Soundcast TAZs to SnoCast MAZs
- Modify the land use input data to match the County's land use allocations and buildable lands projections  
*(this required modification of tazdata.in data input file)*
- Run a SOLA assignment on the SnoCast network

# Developing a SnoCast Network

- Some specifics

- Create extra attributes to define the network representing Snohomish County
  - @snocastnodes==1 for nodes representing Snohomish County
  - @snocastlinks==1 for links representing Snohomish County
- Prior preparation of a TAZ to MAZ correspondence file
- Use the toolbox “*rezone\_matrix\_data*”\*\* to split TAZs into MAZs
- And then run a SOLA traffic assignment on the split-zoned network

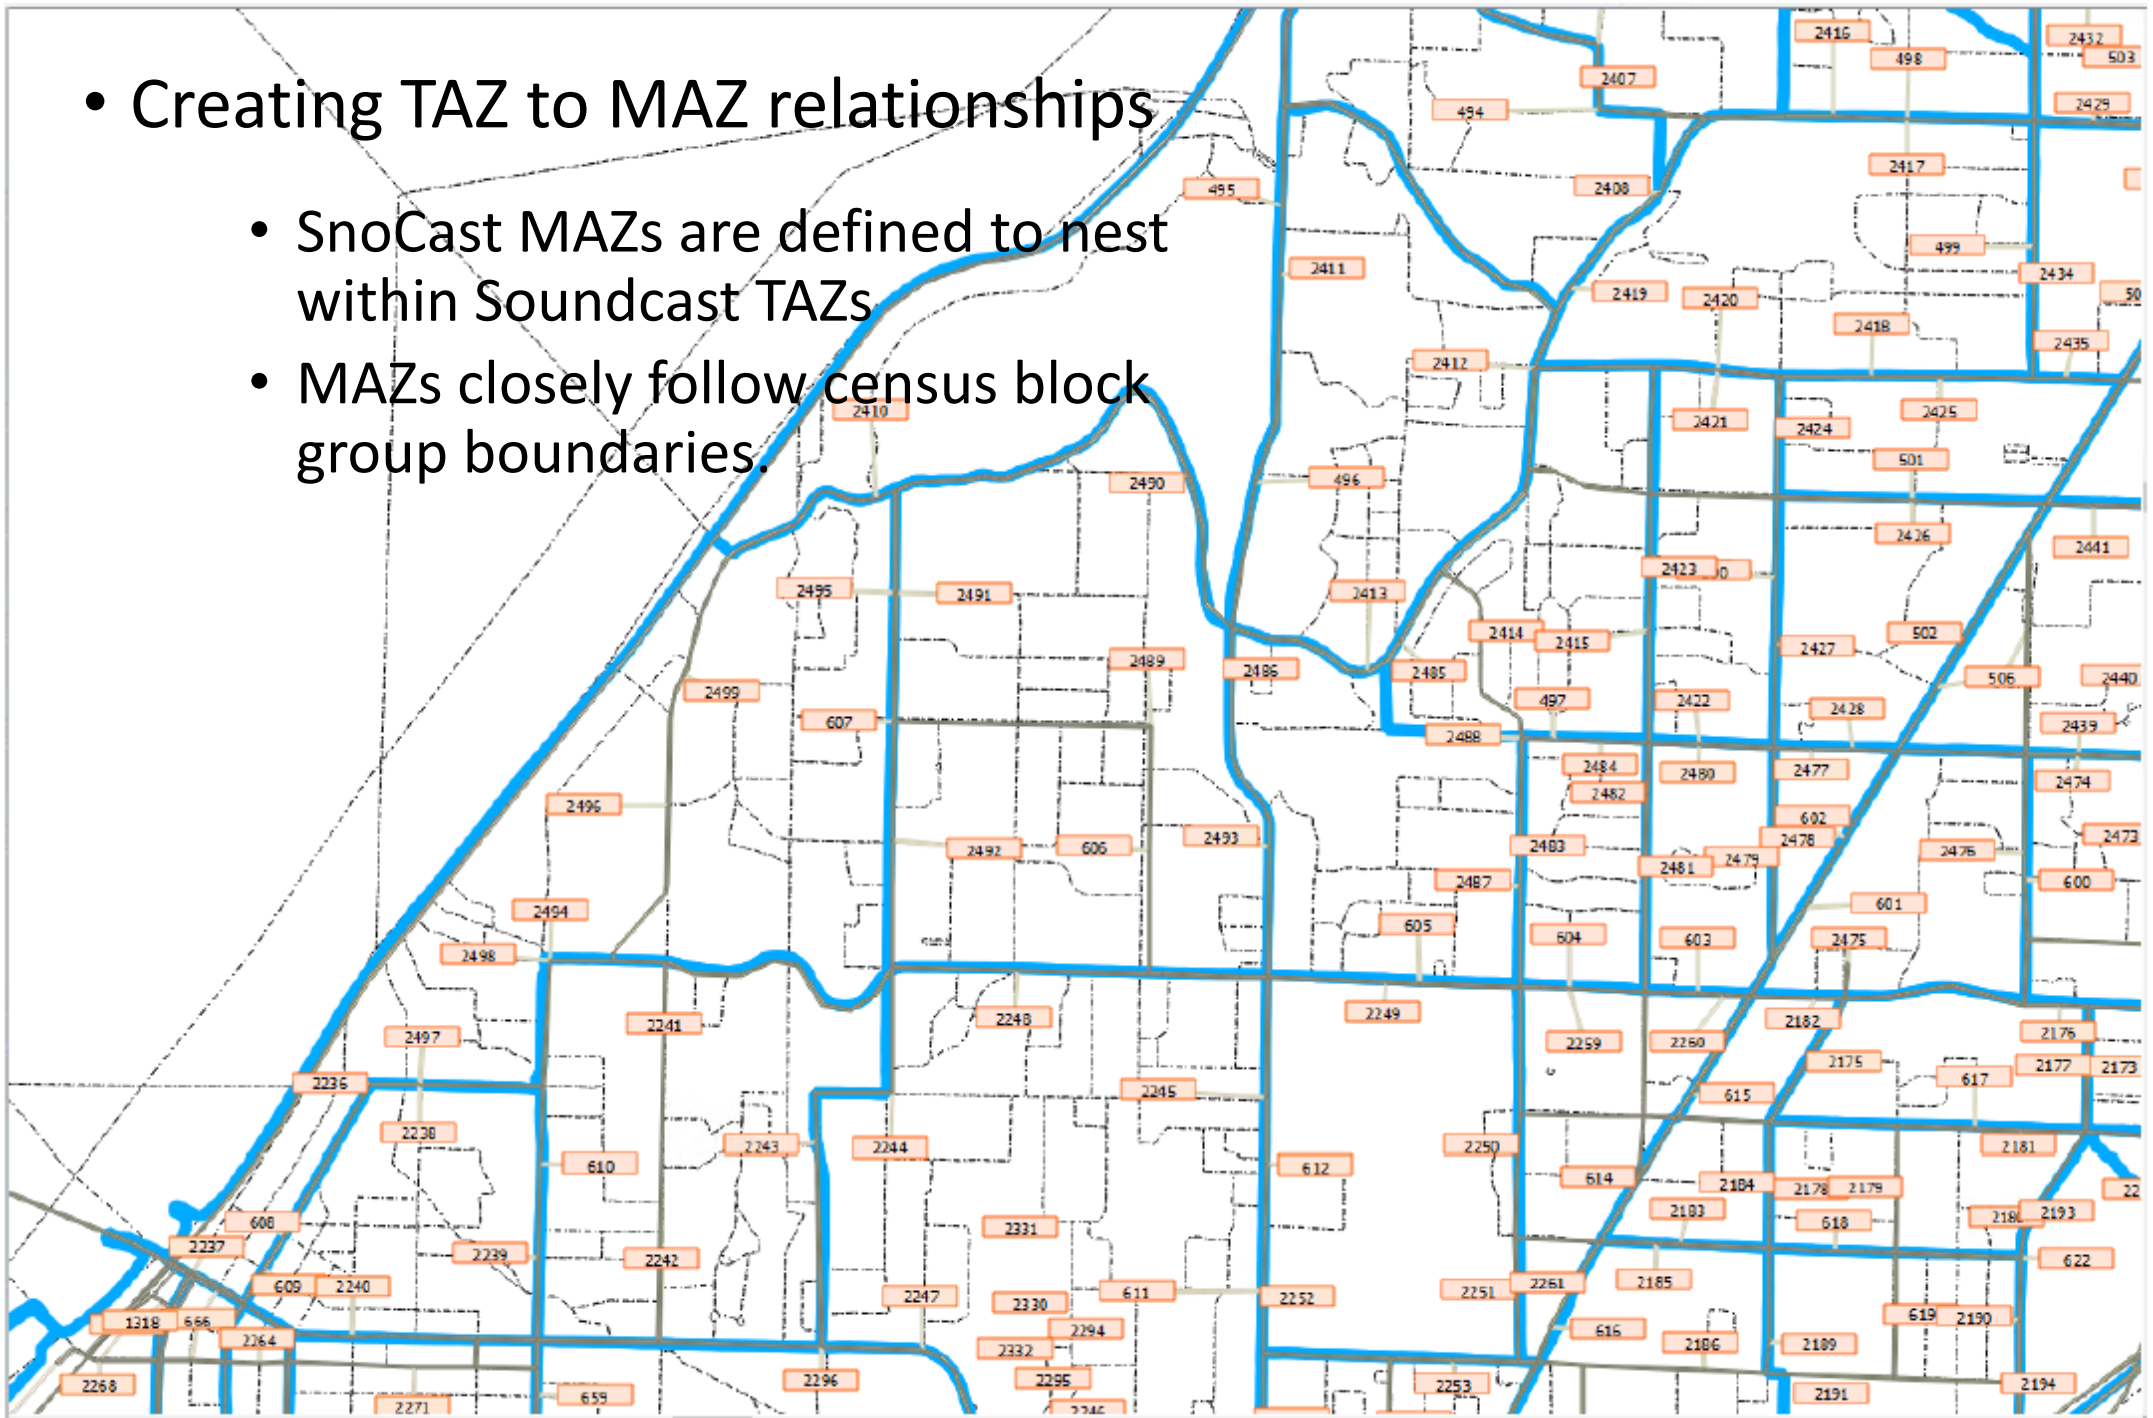

*\*\* this toolbox was provided to us by INRO*

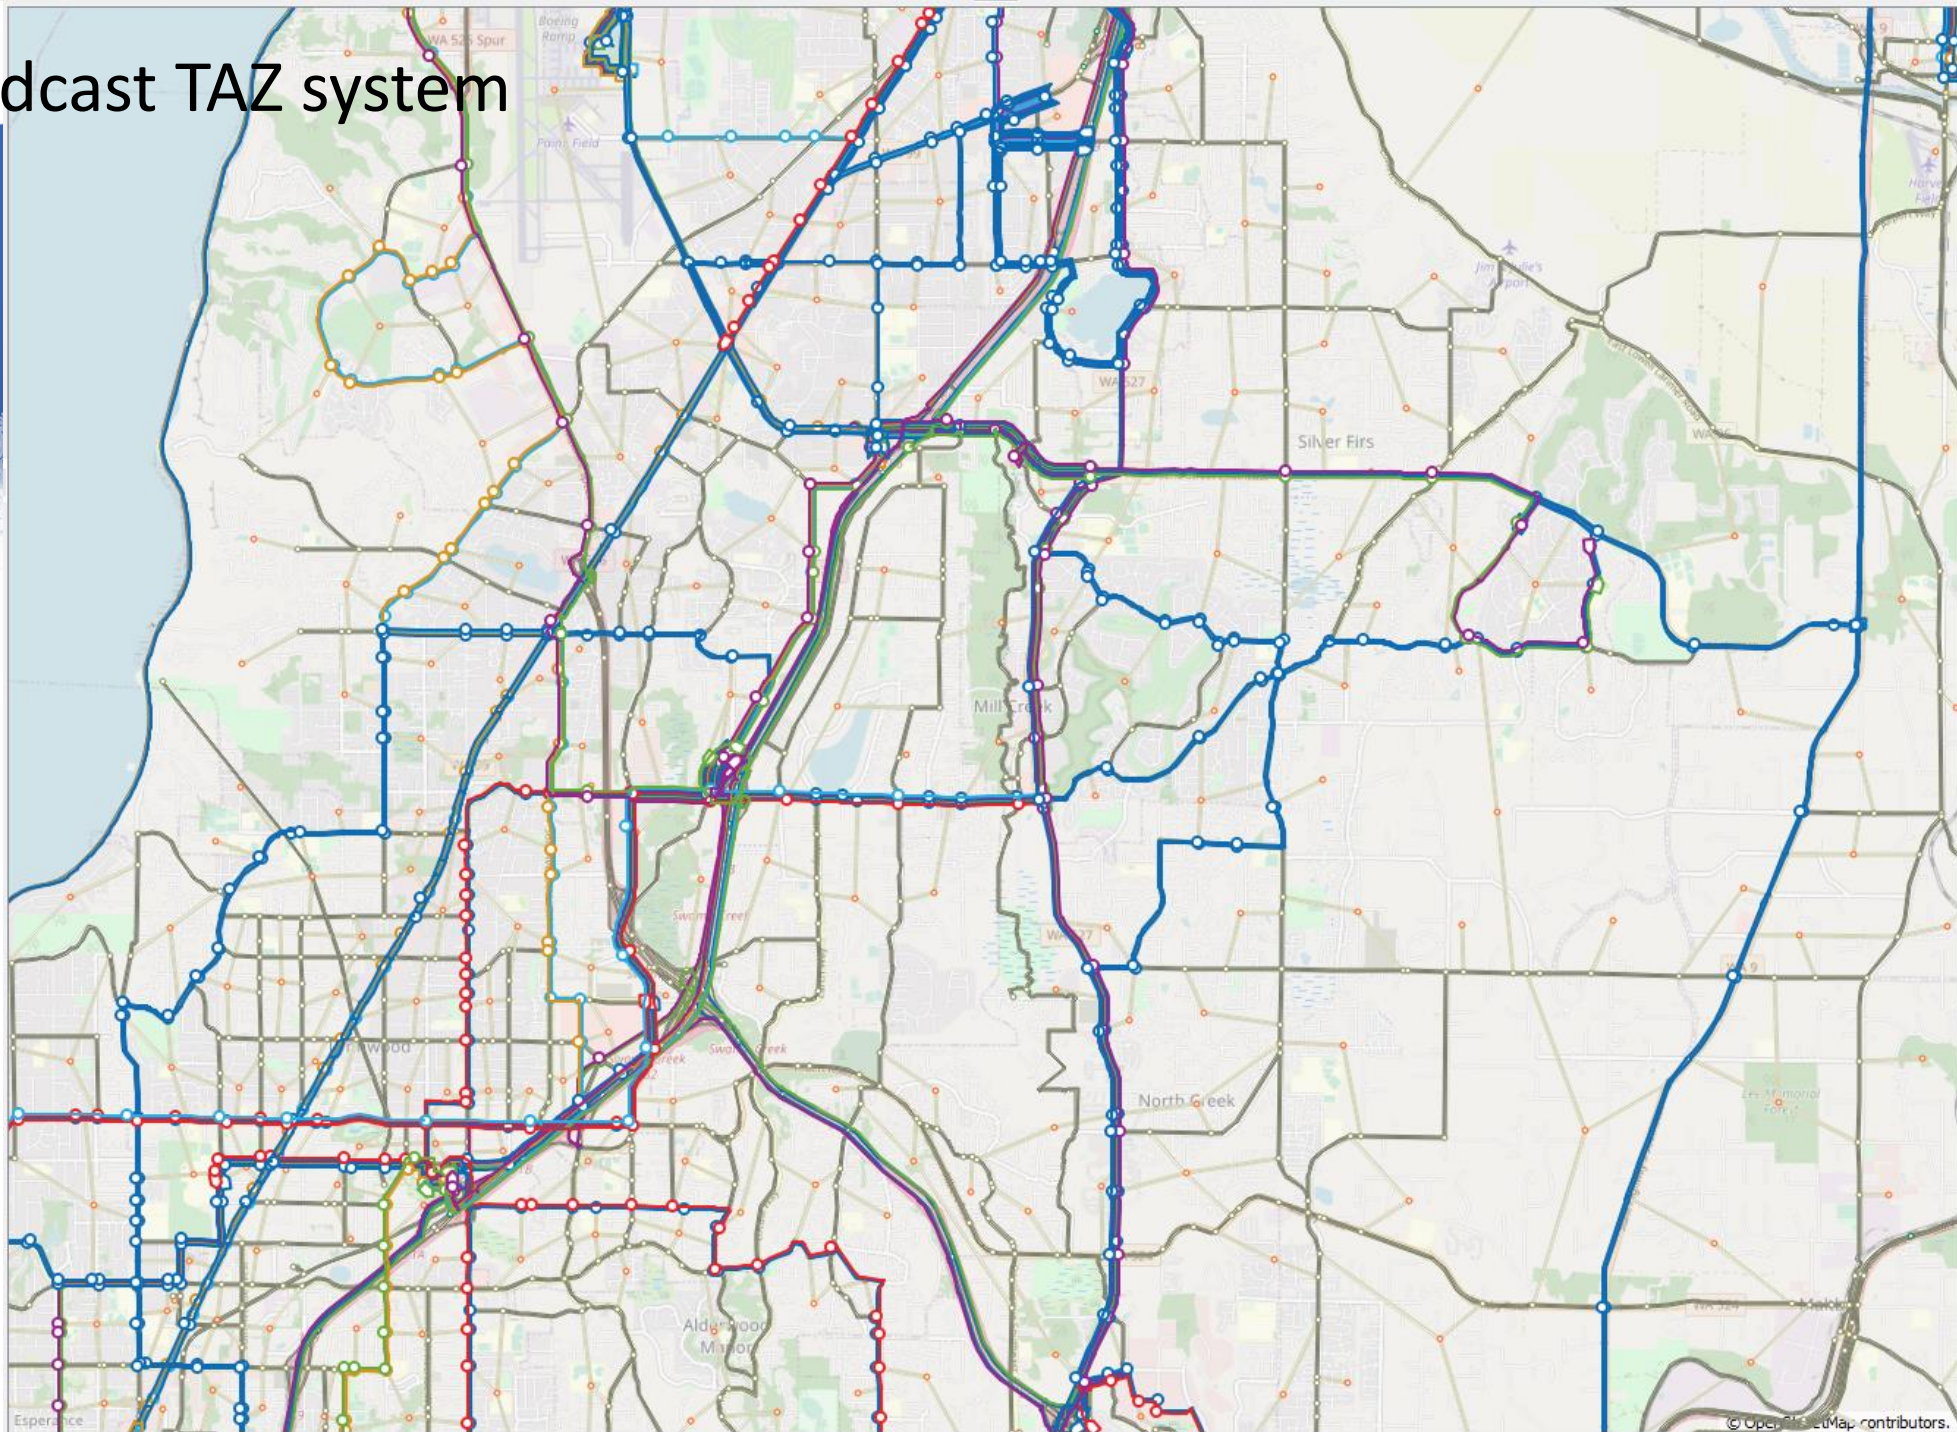

• SnoCast  
Sub Regional Network  
Shown with Transit Lines

- Creating TAZ to MAZ relationships

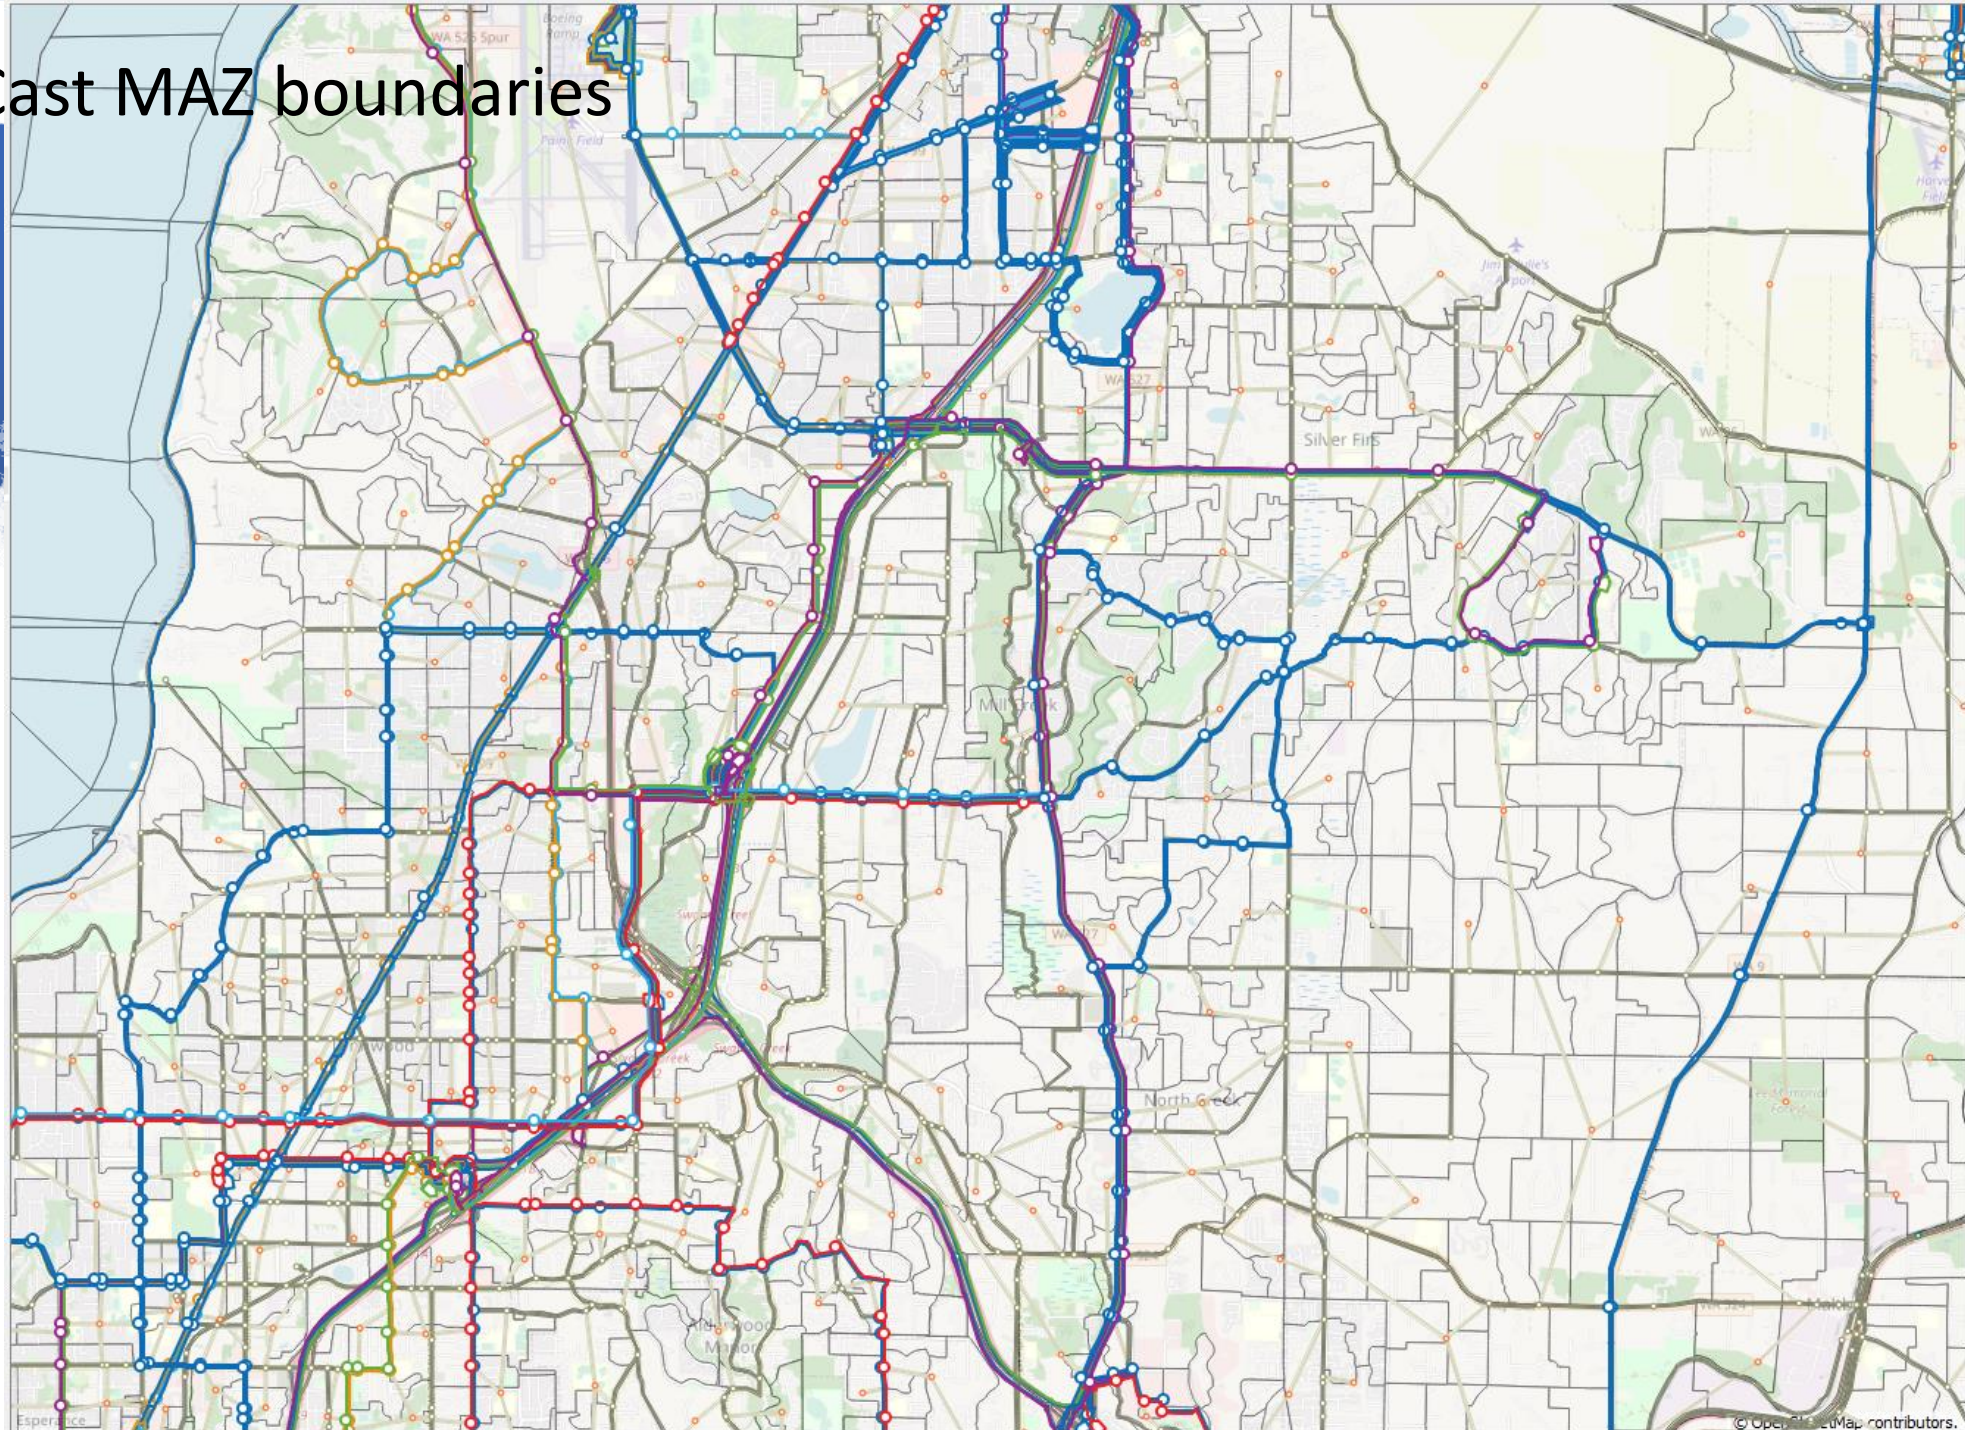

- SnoCast MAZs are defined to nest within Soundcast TAZs
- MAZs closely follow census block group boundaries.

- Soundcast TAZ system

- SnoCast MAZ boundaries

# Comparing Model Networks

- Soundcast Model

- 495 TAZs – to represent SC
- Uses LODES data
- Auto Network
  - Freeways
  - Arterials
  - Collectors

- SnoCast Model

- 3500 MAZs – to represent SC
- Uses refined LODES data
- Expanded Auto Network
  - Freeways
  - Arterials
  - Collectors
  - Local roads
  - Access roads
  - Drive ways

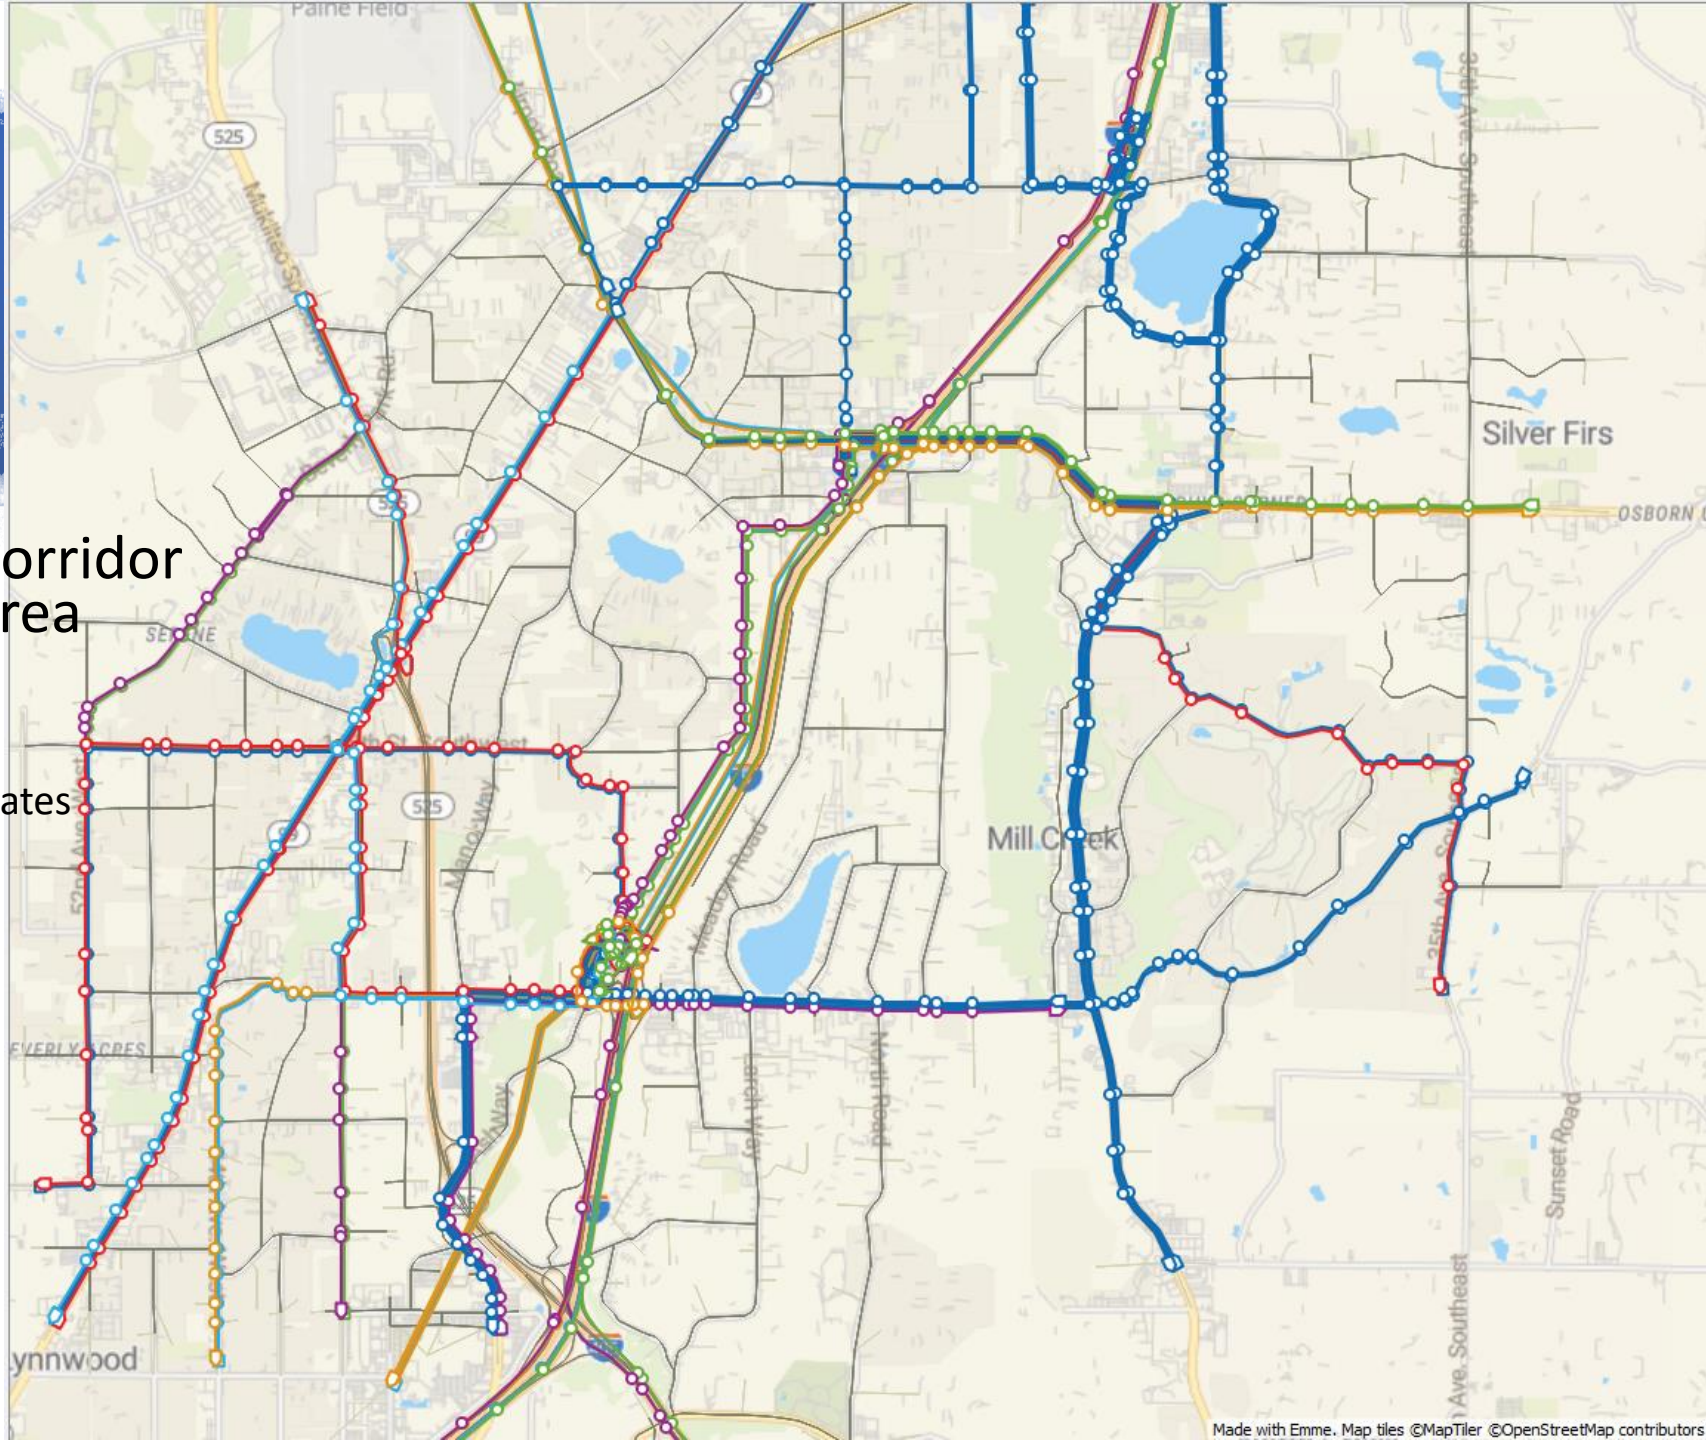

# A Recent Application of SnoCast. East West Corridor Sub Area Study

- Objective: To provide input data to a Dynameq mesoscopic model for the EWC study area
- Task: To output hourly trip tables for PM period
  - From 1:00 PM – 9:00 PM (8-hours duration)
  - Output trip tables for three modes from a SnoCast created sub area model
    - SOVs – drive alone vehicles
    - HOVs – sum of HOV2, HOV3 and Vanpools
    - Trucks – sum of light, medium and heavy trucks
- Use EMME-Modeler tools to export the created trip tables directly to Dynameq

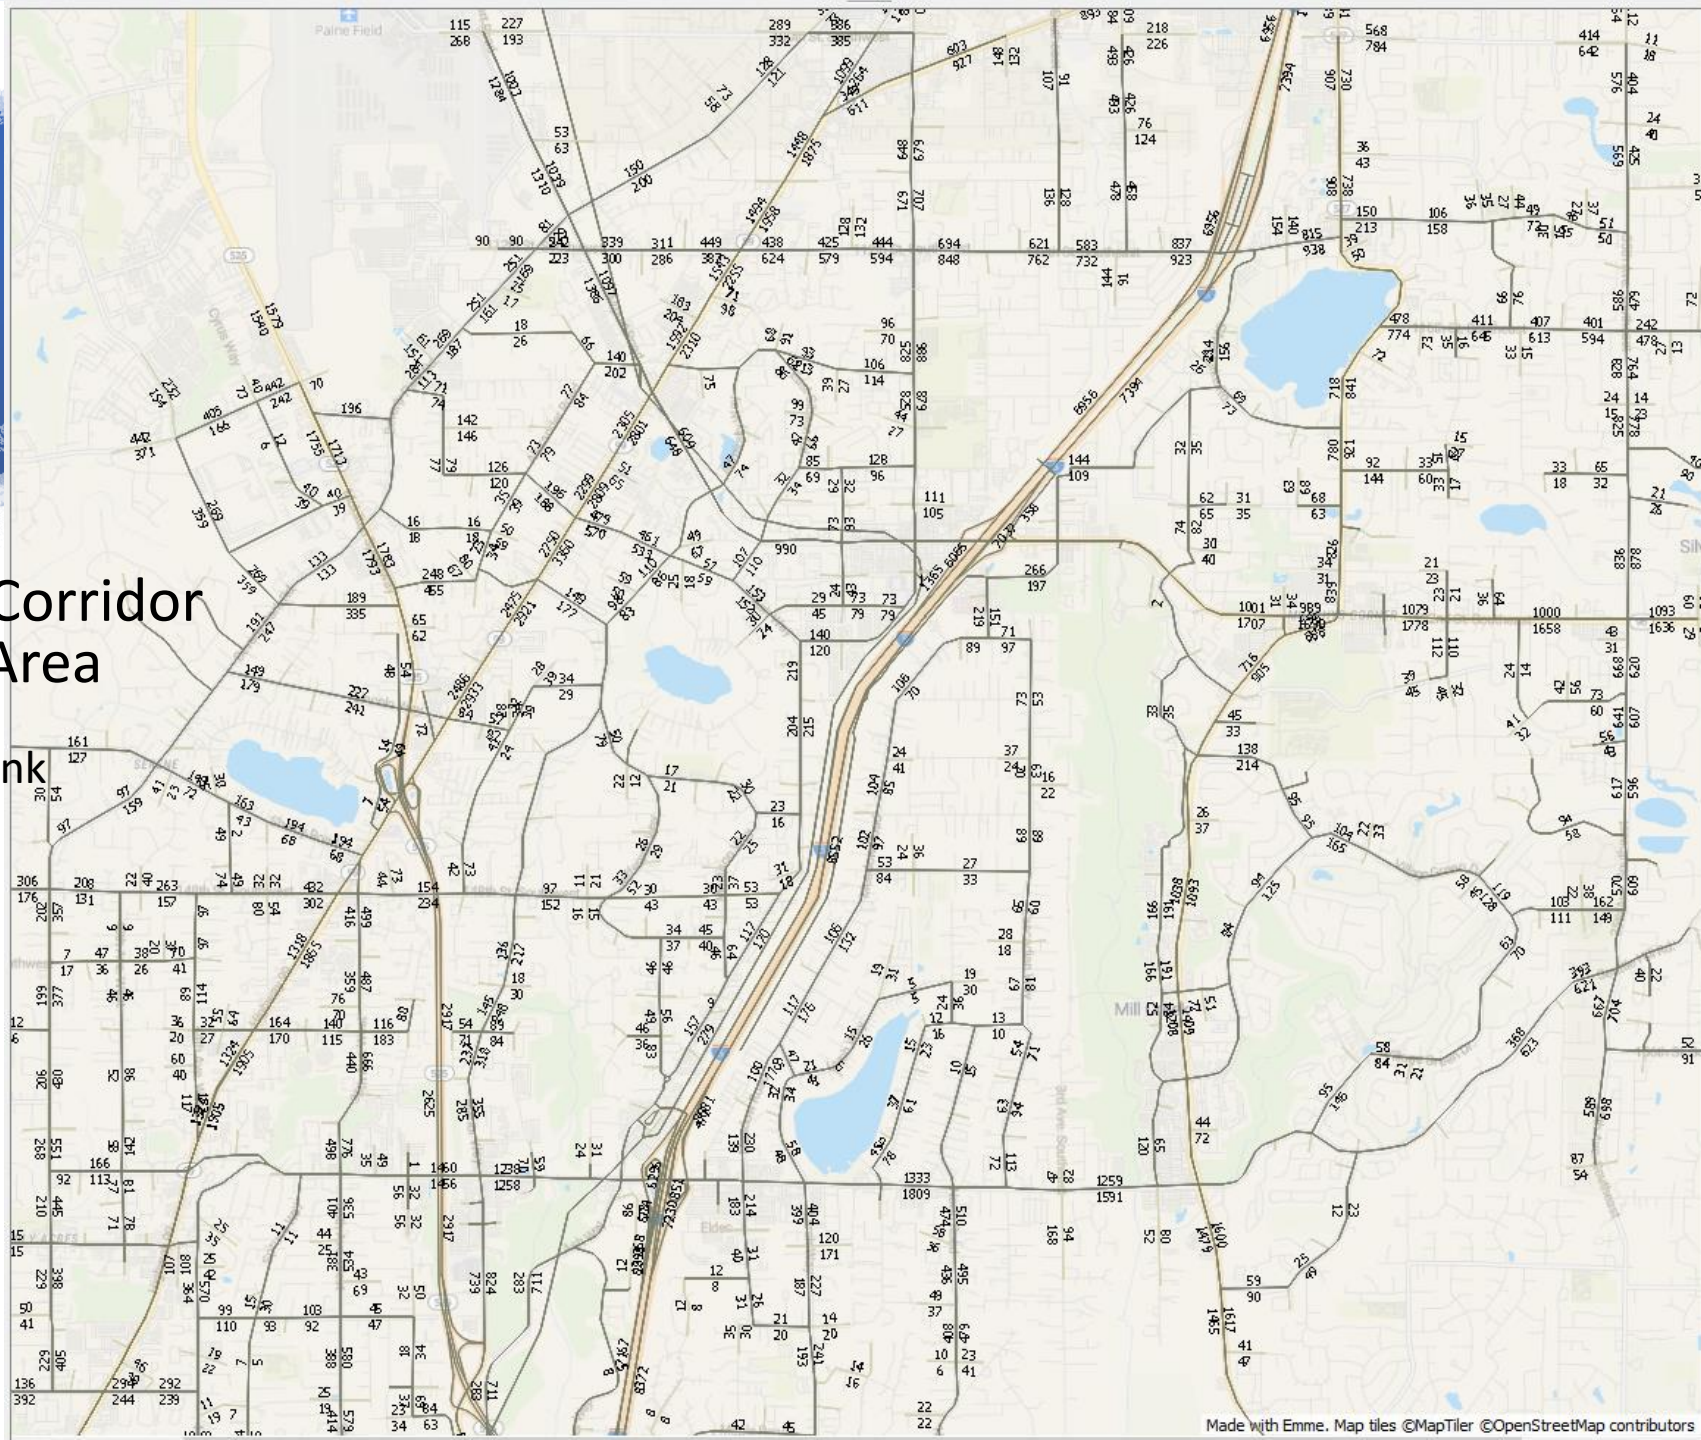

- East West Corridor Study Area

- 45 Transit lines
- 490 MAZs and gates
- 95 signalized intersections

- East West Corridor Study Area

PM peak hour Link volumes

# Calibrating the Sub Area Volumes

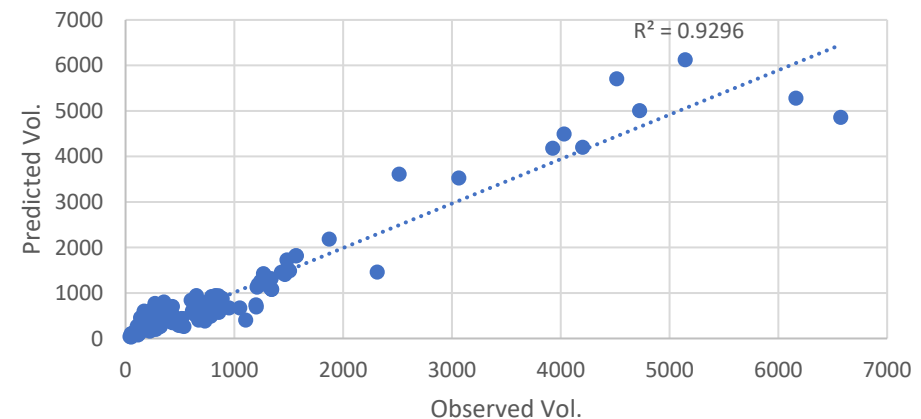

# Calibration Statistics – Before Peak Travel

1:00 p.m. (TSH 0) CV/MV

- R-Squared = 0.9538
- Correlation Coeff = 0.977

2:00 p.m. (TSH 1) CV/MV

- R-Squared = 0.9296
- Correlation Coeff = 0.964

# Calibration Statistics - Peak Travel 1

3:00 p.m. (TSH 2) CV/MV

- R-Squared = 0.9359
- Correlation Coeff = 0.967

4:00 p.m. (TSH 3) CV/MV

- R-Squared = 0.9362
- Correlation Coeff = 0.968

# Calibration Statistics – Peak Travel 2

5:00 p.m. (TSH 4) CV/MV

- R-Squared = 0.9346
- Correlation Coeff = 0.967

6:00 p.m. (TSH 5) CV/MV

- R-Squared = 0.9497
- Correlation Coeff = 0.975

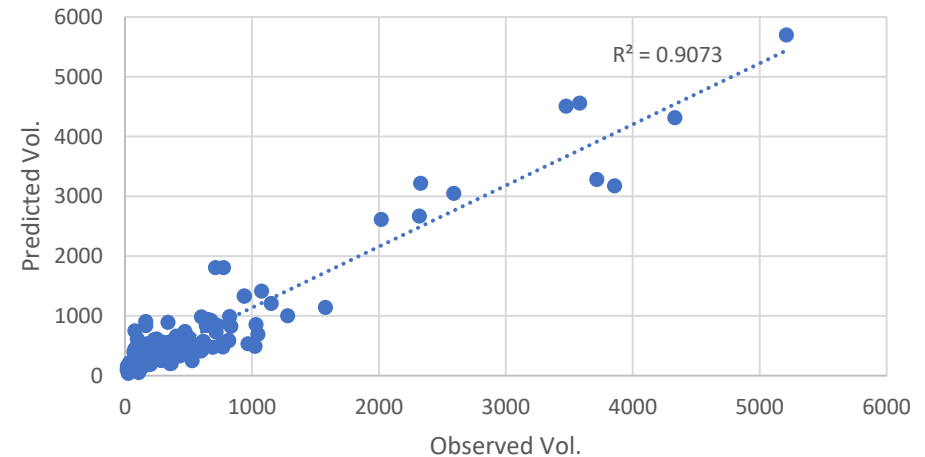

# Calibration Statistics – After Peak Travel

7:00 p.m. (TSH 6) CV/MV

- R-Squared = 0.9313
- Correlation Coeff = 0.965

8:00 p.m. (TSH 7) CV/MV

- R-Squared = 0.9073
- Correlation Coeff = 0.953

# Summary

- Excellent correlation between observed counts and model results for study area for all modeled periods

Correlation Coefficient ( R ) > 0.95

- Hourly trip tables output from SnoCast eliminated the need for factoring peak period trip tables

# Potential To Do Tasks

- Calibrate to corridor travel speed studies
- Develop output templates specific to Snocast
- Develop a non-motorized (bike) network for Snohomish county
- Coordinate with transit agencies on future transit networks
- Develop Topsheet output summaries - similar to that produced after each Soundcast run.

A dark blue watercolor splash graphic with irregular, organic edges and some smaller splatters around it, set against a white background. The splash is centered horizontally and vertically.

Thank You
