

Instructions for use of Model Version 4.0.3:

Due to limitations on the release of Employment Data, PSRC releases the inputs needed for modeling with all sensitive employment data removed. For this reason, we have a set of input files that includes the trip ends for use in the model process. The following should be done before launching a PSRC 4K model run:

- 1) Download code and unzip
- 2) Download appropriate “input” file (xxxx_input.zip) and place anywhere on your local machine or your local network (landuse inputs are not included but trip ends are)
- 3) Update the “InputPath” variable in the “4k.ctf” file to point the model to the location where you have stored your input file for the model run.
- 4) Launch the “psrc_4k.bat” file for model execution.

If there are any questions, please let Kris Overby (koverby@psrc.org) or Craig Helmann (chelmann@psrc.org) know and we will be happy to help.

The PSRC Modeling Team
